

# Full Stack Discovery and Assessment for Hybrid IT

Whether you're managing IT infrastructure across data centers and cloud, preparing for a cloud migration as part of a larger digital transformation project, or investing in IT automation, having accurate, real-time information on your IT estate is critical to your success. Use Device42 to increase visibility and agility, while reducing risk, as you continue your digital transformation journey.

## MANAGE

- Data Center & Cloud Management
- Change Management
- IT Asset Management
- Security Audit & Compliance

## TRANSFORM

- Cloud and Data Center Migration
- Data Center Consolidation
- Capacity Planning
- Cloud Migration Planning

## MODERNIZE

- IT Agility & Automation
- Enable AIOps
- Consolidación
- DevOps Practice
- Full Stack Hybrid IT Discovery

## DEVICE42 FOR IT INFRASTRUCTURE MANAGEMENT

As IT infrastructure grows, companies struggle to keep up with the ever-increasing complexity. Manual approaches to tracking assets such as spreadsheets quickly break down when that IT estate grows beyond even a small size and continue to fail as the infrastructure grows to include multiple locations and cloud assets. Yet this information is critical for running the modern enterprise. Using Device42, IT teams can increase visibility and agility while lowering mean-time-to-resolution (MTTR) – all from a single dashboard.

FEATURE	BENEFIT
Automatic, agentless Infrastructure discovery	Real-time, accurate IT visibility
Integrated ITAM / CMDB solution	Single source of IT truth
Software license management	Reduced compliance risk
DCIM capabilities	Reduced manual effort
IPAM	Increased visibility across all systems
Password management	Reduced security risk
Extensive integrations	Push infrastructure data to all the tools your IT management uses

## DEVICE42 FOR IT TRANSFORMATION

Moving to hybrid infrastructure requires a deep understanding of both infrastructure and applications. Organizations moving applications, whether it's from one data center to another, or from the data center to the cloud, often lack the service-level visibility needed to effectively manage and mitigate the risk associated with the move.

Device42 brings automatic service-level application visibility, instantly identifying all the services that support the application. This includes a broad range of infrastructure including physical, virtual, cloud, and containers. Once discovered, Device42 assesses the resource utilization of the infrastructure and uses this data to make detailed cloud infrastructure recommendations to make sure the application performs properly after the move.

To complete the migration journey, Device42 connects with major migration tool sets including AWS Migration Evaluator, CloudEndure, and Migration Hub, together with Microsoft Azure Migrate, Carbonite, and RiverMeadow.

FEATURE	BENEFIT
Agentless Infrastructure & application discovery	Reduced manual effort
Automatic Application Dependency Mapping	Reduced risk of application failure post move
Resource Utilization	Accurate and appropriate infrastructure sizing
Cloud Recommendation Engine	Accurate, predictable cloud cost estimates, reduced time to move to cloud
Integration with migration solutions	Reduced manual configuration effort
Open data model and API	Pull data into any transformation or business intelligence tools

IT infrastructure has never been more complex.  
Tame that complexity and manage your entire IT estate with Device42.
